subset of $\mathbb{R}^2 \rightarrow$ a collection of points on $\mathbb{R}^2$

A

T

H

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

$$P = \{$$

(x, y)

$\}$ $P \subseteq \mathbb{R}^2$

$$P' = \{ \text{math word on } \mathbb{R}^2 \} \quad P' \subseteq \mathbb{R}^2$$

$$K' = \{ \text{vertical math word on } \mathbb{R}^2 \} \quad K' \subseteq \mathbb{R}^2$$

$$W' = \{ \dots \} \quad W' \subseteq \mathbb{R}^2$$

$$B' = \{ \dots \} \quad B' \subseteq \mathbb{R}^2$$

$$\mathcal{P}(\mathbb{R}^2) = ? = \text{set of all subsets of } \mathbb{R}^2$$

Mind blowing!

$\mathcal{P}(\mathbb{R}^2)$ includes

- $\rightarrow$ any text written on coordinate plane
- $\rightarrow$ graph of any math. function
- $\rightarrow$ text of "~~Book of Proof~~" any book written until now will be written in the future, any book that will never be written,

$\rightarrow$ any image

$\rightarrow$ any imaginable combination of points on $\mathbb{R}^2$

$$\mathcal{P}(\mathbb{R}^3) = ? \quad \text{same thing for 3-D space}$$

$$\mathcal{P}(\mathcal{P}(\mathbb{R}^2)) = ? \quad \mathcal{P}(\mathcal{P}(\mathbb{R}^3)) = ?$$
